The invention also provides for the use of I for the treatment and/or prophylaxis of an inflammatory and/or allergic disease, such as chronic obstructive pulmonary disease (COPD), asthma, rheumatoid arthritis, allergic rhinitis or atopic dermatitis. Eight biol. methods are given. For example, coupling of acid II with 2-phenyl-2-propanamine gave title compound III. Selected I inhibited PDE4B with IC50 in the range of. I are in particle size-reduced form (DC50 value of about 0.5 to about 10 μ) when used in inhalant compns.

AB The invention relates to amino acid derivs. I [A is a lipophilic group including an aliphatic bridging group, B is a lipophilic group, D is a group having at least one (un)substituted amino group, R is H, alkyl or cycloalkyl] and their pharmaceutically acceptable salts and individual isomers which have growth hormone releasing activity in humans or animals and are useful, e.g., in treating osteoporosis, bone fractures, wounds or burns. Thus, a 2-step synthesis afforded amide II.HCl, which showed growth hormone releasing activity, 10-8 M.

Representative compds. I showed at least 80% inhibition of fungal infestation in 3 high less.

possess useful plant protecting properties and may be employed
advantageously in agricultural practice for controlling or preventing the
infestation of plants by phytopathogenic microorganisms, especially fungi. For
example, 3-chlorolactic acid was coupled with 4-chlorophenol in 3.3N NaOH
to give 3-(4-chlorophenoxy)-2-hydroxypropionic acid. Amidation with
2-[3-methoxy-4-[(prop-2-ynyl)oxy]phenyl]ethylamine HCl in the presence
of N,N-diisopropylethylamine in DMF, followed by etherification with
propargyl bromide in toluene provided the
N-(phenethyl)-α-(propargyloxy)propionamide II. The latter showed
residual protective action and residual curative action against fungal
infestation by Plasmopara viticola on vines, Phytophthora on tomato
plants, and Phytophthora on potato plants by 80-100% at 200 ppm. [This

possess useful plant protecting properties and may be employed
advantageously in agricultural practice for controlling or preventing the
infestation of plants by phytopathogenic microorganisms, especially fungi. For
example, 3-chlorolactic acid was coupled with 4-chlorophenol in 3.3N NaOH
to give 3-(4-chlorophenoxy)-2-hydroxypropionic acid. Amidation with
2-[3-methoxy-4-[(prop-2-ynyl)oxy]phenyl]ethylamine. HCl in the presence
of N,N-diisopropylethylamine in DMF, followed by etherification with
propargyl bromide in toluene provided the
N-(phenethyl)-\alpha-(propargyloxy)propionamide II. The latter showed
residual protective action and residual curative action against fungal
infestation by Plasmopara viticola on vines, Phytophthora on tomato
plants, and Phytophthora on potato plants by 80-100% at 200 ppm. [This

possess useful plant protecting properties and may be employed
advantageously in agricultural practice for controlling or preventing the
infestation of plants by phytopathogenic microorganisms, especially fungi. For
example, 3-chlorolactic acid was coupled with 4-chlorophenol in 3.3N NaOH
to give 3-(4-chlorophenoxy)-2-hydroxypropionic acid. Amidation with
2-[3-methoxy-4-[(prop-2-ynyl)oxy]phenyl]ethylamine HCl in the presence
of N,N-diisopropylethylamine in DMF, followed by etherification with
propargyl bromide in toluene provided the
N-(phenethyl)-α-(propargyloxy)propionamide II. The latter showed
residual protective action and residual curative action against fungal
infestation by Plasmopara viticola on vines, Phytophthora on tomato
plants, and Phytophthora on potato plants by 80-100% at 200 ppm. [This

These compds. possess useful plant protecting properties and may be employed advantageously in agricultural practice for controlling or preventing the infestation of plants by phytopathogenic microorganisms, especially fungi. For example, 3-chlorolactic acid was coupled with 4-chlorophenol in 3.3N NaOH to give 3-(4-chlorophenoxy)-2-hydroxypropionic acid. Amidation with 2-[3-methoxy-4-[(prop-2-ynyl)oxy]phenyl]ethylamine+HCl in the presence of N,N-diisopropylethylamine in DMF, followed by etherification with propargyl bromide in toluene provided the $N-(phenethyl)-\alpha-(propargyloxy)$ propionamide II. The latter showed residual protective action and residual curative action against fungal infestation by Plasmopara viticola on vines, Phytophthora on tomato plants, and Phytophthora on potato plants by 80-100% at 200 ppm. AB Compds, R1(CH2)nCHR2CO-A-NHCH((CH2)gCO2R3)CO-B (A is a natural or unnatural amino acid; B = H, D, alkyl, cycloalkyl, (un)substituted Ph or naphthyl, 2-benzoxazolyl, halomethyl, (CH2)mcycloalkyl, (CH2)m(1- or 2-naphthyl), substituted 2-oxazolyl, (un)substituted (CH2)mphenyl, CH2OCO(arvl), or CH2OCO(heteroarvl), etc.; R1 = (un)substituted cycloalkyl, Ph. naphthyl, or heteroaryl; R2 = H. alkyl, cycloalkyl, (un) substituted Ph, (CH2) mNH2, (un) substituted (CH2) mphenyl, (CH2) mcycloalkyl, (CH2) mheteroaryl, etc.; R3 = H, alkyl, cycloalkyl, (cycloalkyl)alkyl, (un)substituted phenylalkyl; m = 1-4, n = 0-2; q = 1-2] or their pharmaceutically-acceptable salts were prepared as inhibitors of the ICE/ced-3 family of cysteine proteases (ICE = interleukin-1β converting enzyme). Thus, coupling of (1-naphthyl)acetic acid with (3S)-3-(leucinylamino)-4-oxobutanoic acid tert-Bu ester semicarbazone (preparation given) followed by deprotection of the resulting intermediate with TFA, and treatment with a 3:1:1 solution of MeOH/AcOH/37% HCHO afforded (3S)-3-[[N-[(1-naphthyl)acetyl]leucinyl]amino]-4-oxobutanoic acid. The invention is also directed to pharmaceutical compns. containing these compds., as well as the use of such compns. in the treatment of patients suffering

inflammatory, autoimmune and neurodegenerative diseases, for the

prevention of ischemic injury, and for the preservation of organs that are to undergo a transplantation procedure.

AB Claimed are compds. having the general structure R1CR2:CR3C(:X)YR4 or R1R2CHCR3R3C(:X)YR4 (I; variables defined below; e.g.

(2E)-3-[4-(tert-butyl)phenyl]-N-phenylprop-2-enamide and (2,3-dihydrobenzo(1,4)dioxin-6-vl)[4-(4-dimethylaminophenyl)pyridin-2yl]amine) and compns. containing them, for the treatment of acute, inflammatory and neuropathic pain, dental pain, general headache, migraine, cluster headache, mixed-vascular and nonvascular syndromes, tension headache, , general inflammation arthritis, rheumatic diseases, osteoarthritis, inflammatory bowel disorders, inflammatory eye disorders, inflammatory or unstable bladder disorders, psoriasis, skin complaints with inflammatory components, chronic inflammatory conditions, inflammatory pain and associated hyperalgesia and allodynia, neuropathy pain and associated hyperalgesia and allodynia, diabetic neuropathy pain, causalgia, sympathetically maintained pain, deafferentiation syndromes, asthma, epithelial tissue damage or dysfunction, herpes simplex, disturbances of visceral motility at respiratory, genitourinary, gastrointestinal or vascular regions, wounds, burns, allergic skin reactions, pruritis, vitiligo, general gastrointestinal disorders, gastric ulceration, duodenal ulcers, diarrhea, gastric lesions induced by necrotising agents, hair growth, vasomotor or allergic rhinitis, bronchial disorders or bladder disorders. I are thought to be vanilloid receptor ligands, but no test data are provided. Although the methods of preparation are not claimed, apprx.130 example prepns, and characterization data for .apprx.400 I are included. For I: R1 is Ph. naphthyl or (un)saturated 5- or 6-membered ring heterocycle; R2 is H, hydroxy, halo, C1-6alkyl, or (un)saturated 5- or 6-membered ring heterocycle; or R1 and R2 together are o-benzenediyl-L1-o-benzenediyl. R3 is H or C1-4alkyl; or R1 and R3 together are o-benzenediyl-L2- or -Z-L2- (Z = pyridine-2,3-diyl). R4 is Ph, (un)saturated 5- or 6-membered ring heterocycle, 10-membered bicyclic ring comprising fused 6-membered rings, containing 0-4 N atoms with the remainder being C atoms, with at least one of the 6-membered rings being aromatic; X is O, S or NRa; or X and R2 together are :N-CH:CH-, :C-O-, :C-S-, or :C-NRa-; Y is NH or O; addnl. details including provisos are given in the claims. 1064718-76-8

For example, reaction of 2-13-methoxy-4-[(prop-2-ynyl) oxyl) phenyl]ethylamine HCl and L-(+)-mandelic acid in the presence of N.N-diisopropylethylamine in DMF gave the amide. Etherification with propargyl bromide in toluene provided II. The latter showed residual protective action and residual curative action against fungal infestation by Plasmopara viricola on vines, Phytophtora on tomato plants, and Phytophthora on potato plants by 80-100% at 200 ppm.

Condensation of @-bromo-5,6,7,8-tetrahydro-2-acetonaphthone (I) with AB amines leads to substituted @-amino-5,6,7,8-tetrahydro-2-

acetonaphthones (II). The latter can be reduced by hydrogenation to give III. To a solution of 120 g. I in 700 mL. anhydrous Et20 was added at 15° 60 g. iso-PrNH2 in 200 mL. Et20. After standing 15-20 h. at

10°, the solution was filtered, evaporated in vacuo, and the residue taken up in Et20 and treated with HCl gas to give

m-isopropylamino-5,6,7,8-tetrahydro-2-acetonaphthone-HCl (II) (R:

iso-Pr) (IV), m. 208-9°. An alc. solution of 50 g. IV was hydrogenated over 2 g. Pd-C (10% Pd) at 2-5 atmospheric, filtered, and

evaporated to give 2-isopropylamino-1-(5,6,7,8-tetrahydro-2-naphthyl)ethanol-HCl (III)

(R: iso-Pr), m. 160-2°. Similarly prepared were the following compds. (compound, R, and m.p. given): II, sec-Bu, 182-4°; III,

sec-Bu, 129-30°; II, tert-Bu, 226-7°; III, tert-Bu,

196-7°; II, PhCH2CHMe (V), 210-11°; III, PhCH2CHMe, 142-3°; II cyclohexyl, 231-2°; III, cyclohexyl,

178-9°. Most HCl salts were recrystd. from EtOH-Et2O, but V was recrystd. from EtOH.

AR The compds. were prepared by catalytic hydrogenation of aminoketones and isolated as hydrochlorides; they were soluble in H2O and alc., less soluble in Me2CO, and insol. in ether. The aminoketones used were obtained by reaction, in anhydrous ether, of ω-bromo-5,6,7,8-tetrahydro-2acetonaphthone (I) (prepared by bromination, in ether, in the presence of C13A1) with an excess of amine containing the iso-Pr, iso-Bu, tert-Bu, cyclohexyl, and 2-phenyl isopropyl radicals. In an example, 160 ml. anhydrous ether containing 25.3 g. I was mixed with 12.7 g. iso-PrNH2 in 20 ml. anhydrous ether at 15-20°; after continuous stirring 7 hrs., the mixture was filtered, the solvent evaporated in vacuo, the non-reacted amine filtered, and the filtrate acidified with an ether solution of dry HCl to yield 19 q. ω-(isopropylamino)5,6,7,8 tetrahydro-2-acetonaphthone hydrochloride, m. 208-9°. Similarly were prepared the following N-substituted mamino5,6,7,8-tetrahydro-2-acetonaphthones (substituent and m.p. given): iso-Bu, 182-4°; tert-Bu, 226-7°; cyclohexyl, 231-2°. and 2-phenylisopropyl, 210-11°. Also prepared were the following (II) (R and m.p. given): iso-Pr, 160-2°; iso-Bu, 129-30°; tert-Bu, 196-8°; cyclohexyl, 178-9°; and

2-phenylisopropyl, 143-4°. II 1082682-40-3P

Racemic Tetralin p-quinol (I) was resolved into the optical antipodes via the strychnine (II) salts of the acid 3-nitrophthalates. The configuration and conformation of the antipodes is discussed and related to the configuration and conformation of the estra-p-quinols on the basis of the optical shift rule and the rotational dispersion. From this the absolute configuration of the antipodes of I is deduced. Tetralin nitrated by the method of Schroeter (CA 16, 1763) gave a vellow oily mixture of 5- and 6-nitro derivs., b13 156-65°; a 90-g. portion in 400 cc. hot EtOH treated with 5.5 g. NH4Cl in 80 cc. H2O and then with stirring above 70° during 10 min. with 70 g. In dust, stirred 10 min., filtered at 65-70°, the residue washed with 80% EtOH, the combined filtrates poured into 2.5 1. H2O and extracted with 600 cc. Et2O, the extract shaken immediately with 250 cc. 10% H2SO4 to precipitate the sulfate of the 6HONH

derivative of Tetralin, the aqueous phase again extracted with 600 cc. Et20, and the extract

shaken with H2SO4 and filtered, the Et2O phase separated, the filter residues suspended in the combined aqueous phases and extracted 10 hrs. with C6H6, and the

extract evaporated gave 22 g. dark oil which diluted with 50 cc. cyclohexane deposited 5-6 g. pure I, m. 125-6° (Me2CO and EtOAc); the original Et20 phase evaporated, the residue (55 g.) distilled, and the distillate (40

g.), b13 150-65°, refrigerated gave 5-nitro derivative of Tetralin, m. 34-5° (MeOH); the distillation residue (15 g.) gave some 6,6'-azoxy derivative of Tetralin, m. 99-100°. I (1.3 g.) and 4.3 g. 3-nitrophthalic anhydride heated 7 hrs. at 40-5° in 14 cc. CH2Cl2 and 14 cc. C5H5N, kept overnight, heated 1 hr. at 40°, poured into iced H2O, acidified with N HCl, and extracted with 3:1 CHCl3-CH2Cl2, and the extract worked up gave 1.73 g. 3-nitro-2-phthalate (III) of I, m. 172° (MeOH); the mother liquor evaporated, and residue (1.6 g.) (from several runs) dissolved in 2.5 cc. warm MeOCH2CH2OH and allowed to stand 2 days deposited 820 mg. 3-nitro-1-phthalate (IV) of I, m. 192°. The Rf values were determined with 15:5:6 nonane-C6H6-AcOH for the following compds. (m.p. and Rf value given): Et 3-nitro-2 phthalate, 154°, 0.24; Et 3-nitro-1-phthalate, 107°, 0.18; Bu 8-nitro-2-phthalate. 3-nitro-1-phthalate, 107, 0.107, bu o-hards phthalate, 143°, 0.40; Bu 3-nitro-1-phthalate, 90°, 0.34; III, 172°, 0.18; IV, 192°, 0.13. III (7 mg.) treated 10 hrs. at 45° with a 5-fold excess of K2C03 gave only, unchanged III. II (7 mg.) and 11 mg. 12 mg. 2011 mg. 201 mg.) refluxed 7 hrs. with 2.5 equivs. KOH in MeOH gave only phenolic material and unchanged III; the same result was obtained by refluxing 4 hrs. with 1% H2SO4-MeOH or by keeping several days in MeOH with 1.5 equivs. p-MeC6H4SO3H. III (1.067 g.) in 100 cc. CHCl3 treated with CH2N2-Et2O and the product chromatographed on A12O3 gave 95% 1-Me 2-(Tetralin pquinol) 3-nitrophthalate (V), m. 114-15.5° (1:1

C6H6cyclohexane). Crude V (3 millimoles) in 25 cc. MeOH treated with 60 cc. aqueous K2CO3, kept 5 days at room temperature, treated in the dark with H2O and

CHC13, and the residue from the organic layer chromatographed on Al2O3 yielded 100 mg. yellow, partially crystalline mixture of polymethylene and diMe 3-nitrophthalate (VI), 283 g. crystalline VI, 250 mg. V, 40 mg. yellow oily mixture of III and I, and 140 mg. I. III (7.14 g.) in 250 cc. Me2CO treated with 6.68 g. II in the min. amount of CHC13, concentrated in vacuo at 40° to about 100 cc., diluted with 150 cc. Me2CO, again concentrated to 100 cc., diluted

with 40 ce. H2O of 60°, concentrated to 120 cc., and refrigerated overnight gave 6.2 g. II salt; the salt (6.2 g.) in 20 cc. CHCl3 diluted with 200 cc. Me2CO and concentrated to 100 cc. at 40°, this treatment repeated, and the concentrate diluted with 40 cc. warm H2O and refrigerated overnight gave 5.4 g. salt, [α]2D3 -12° (4:1 EtOH-CHC13), which recrystd. gave 4.3 g. salt, [α]2D5 -11° (4:1 EtOH-CHC13). II salt (4.5 g.), [α]2D4 -12°, in 100 cc. CHC13 shaken with five to seven 30cc. portions 2N HCl, concentrated to 4 cc., and filtered on the next day gave (+)-III, [α]2D5 32° (c 1.25, EtOH), [α]2D6 62° (c 1.25, dioxane), m. 173-4° (MeOH). The original mother liquor evaporated, the residual II salt (7.5 g.), [\alpha]2D2 12° (EtOH- CHCl3), dissolved in 20 cc. H2O, and slowly evaporated gave 2.1 g. crystals, [α]2D4 8° (EtOH-CHC3a); the remaining mother liquor gave 5.6 g. II salt, [α]2D6 14° (EtOH-CHC13); a 5-g. portion decomposed with 2N HCl yielded 1.81 g. (-)-III, m. 170-1° (CHCl3), [α]2D6 -30° (c 0.93, EtOH), $[\alpha]2D5 - 62^{\circ}$ (c 1.69, dioxane). (+)-III (1.07 g.) treated with CH2N2-Et2O, the resulting Me ester sapond, with K2CO3 m MeOH, and the reaction product chromatographed gave 110 mg. (+)-V, m. 119-20°, [α] 2D5 114°, [α] 2D6 111° (c 1, dioxane).

(-)-III (1.8 g.) gave similarly 92 mg. (-)-V, m. 118-19° (EtOAc), $[\alpha]D - 12°$ (c 1, dioxane). 1087735-80-5P RL: SPN (Synthetic preparation); PRP (Properties); PREP (Preparation)

Liberation of bradykinin from plasma by treatment with TITLE: peptone or by boiling with hydrochloric acid

Different fractions of peptone (proteose-peptone, Difco) were obtained by chromatography on the ion exchange resin Amberlite IRC-50. A fraction eluted at pH 7.8 (1.5 g. from about 30 g. of peptone) showed the greatest activity in releasing bradykinin (I) when incubated with heparinized rat plasma. It was also the most active fraction as a histamine releaser. Plasma from rats, when heated 1-10 min. with 0.1N HCl, developed full I activity upon neutralization and incubation at room temperature or at 37°. This spontaneous release of I was enzymic in nature and was inhibited by soy-bean trypsin inhibitor. The material released by HC1 or by the peptone fraction was identified as I by parallel assays on the guinea pig ileum, on the uterus of the rat (the most sensitive method), or by effects of the blood pressure of rabbits. Since the release of I from denatured plasma by trypsin and by snake venom is parallel to the resp. esterase activities of these agents against benzoyl-L-arginine methyl ester, the release of I might provide a very sensitive indication of activation of an enzyme in plasma displaying a similar activity. 18 references.

GB 744972 1950725 GB 1951-17267 19510720 <--3,6-Diamino-9-(2-sulfophenyl)xanthene dyes, whose amino groups can be substituted by aliphatic or aromatic radicals or whose N may be a member

of a heterocyclic ring, are prepared To improve their solubility, the dyes can be further sulfonated. They dye wool and silk in red to blue tints of very good fastness to light and alkalies.

3,6-Dihydroxy-9-(2-sulfophenyl)xanthene (I) 10 is heated with POC13, the excess POC13 is removed by distillation, and the resulting vellow 3.6-dichloro-9-(2-sulfophenyl)xanthene (II) is treated with PhNH2 30 parts several hrs. at 100°. The excess PhNH2 is extracted from the melt with HCl and the dye isolated. After drying it is sulfonated with 95% H2SO4 until it dissolves in dilute Na2CO3, and isolated by pouring into H2O, filtering, dissolving in dilute Na2CO3, and salting out. It does a clear violet. The following shades are obtained by replacing PhNH2: red-violet with o-toluidine (III); bright-red with 2.6-Me2C6H3NH2, 2-MeC6H4NHEt, 2-MeC6H4NHMe, 2,5-Me2C6H4NHMe, (HOCH2CH2)2NH, or piperidine; reddish blue with 4-EtOC6H4NH2 and a still bluer shade with 2-naphthylamine (IV); violet with 2-NaO3SC6H4OC6H4NH2-4; reddish violet with 2-HO3SC6H4NH2 in glycol; red-violet with 3-C1C6H4NH2; clear violet with 2-MeOC6H4NH2, 2-EtOC6H4NH2, 2,4-H2N(C1)C6H4OC6H5(V), or 1-naphthylamine (VI); and navy blue by replacing PhNH2 with 2,3-HO(HOOC)C6H3NH2 or 2,3,5-HO(HOOC)(HO3S)C6H2NH2 in glycol but without after-sulfonation. I 10

2,3,9-HO(HOOC)(HO3S)C6H2NH2 in glycol but without after-sulfonation. I 10 is heated to 130° with 2,4-Me2C6H3NH2 50 in the presence of POC13 10 parts, heated till the color no longer deepens, and the dye is isolated by dissolving out the amine. I t dyes wool violet. Similar dyes are also obtained by using 3,6-dichloro-9-(2,4-disulfophenyl)xanthene (VII) instead of II. VII gives with III, after sulfonation, a soluble clear red-violet dye, with m-toluidine a navy-blue dye, and similar violet shades with VI, various xylidines, chloro- and bromoanilines. A greenish dye is made from

VII with ^{1}V or 2,3-HO(HOOC)C6H3NH2, blue to violet shades with ^{1}V , 3,4-HOOC(HO)C6H3NH2 or 2,5,4-Me2(HO3S)C6H2NH2, red-violet to blue-violet shades with 2,4,5-Me2(HO3S)C6H2NH2 or 2,4,6-Me2(HO3S)C6H2NH2, a gray-blue with 4-H2NC6H4NHC6H5, and a red with 4(or

5)-chloro-2-aminobenzotrifluoride. Similar dyes are also obtained by the same process from II substituted in the benzene ring by a p-ethoxy, a p-chloro-, a 4-hydroxy, and a 3-carboxylic acid group.

Tetralin (66 mg.), 28 g. (CH2O)n, 65 ml. glacial AcOH, 33 g. crystalline H3PO4, and 91 ml. concentration HCl at 85-90° stirred 4 hrs. gave 66%

1,2,3,4-tetrahydro-6-chloromethylnaphthalene (I). With excess II, 10% 5,8-bis(chloromethyl)-1,2,3,4-tetrahydronaphthalene was obtained in addition to I. The 6-piperidinomethyl analog (II of I) was prepared by treating I in Et20 with piperidine at room temperature II decomposed on distillation

Bubbling dry HCl

through II in Et20 gave II.HCl, very hygroscopic. II picrate, m. 150°. 1-(1,2,3,4-Tetrahydro-6-naphthylmethyl)pyridinium chloride,

m. 115°, was prepared (88.5% yield) from 7.2 g. I, 20 ml. absolute Et20, and dry pyridine. H2NC(SR):NH.HCl (R =

1,2,3,4-tetrahydro-6-naphthylmethyl), m. 212°, was prepared (96%

yield) by heating 7.2 g. I with 6 g. thiourea. RCO2H was prepared (42% yield) refluxing crude I with KCN in H2O, and hydrolyzing the nitrile with aqueous NaOH; the hydrolysis was aided, and formation of resinous products was minimized by adding small amts. of 3% H2O2 at intervals. RCONHPh. m.

112°, was obtained by method similar to that described (C.A. 50, 271f).

    Compds. of the type XCH(Ar)CH(NO2)R, in which X is
     5,6,7,8-tetrahydro-2-naphthyl, R is Me or Et, and Ar is a substituted Ph
     group, were prepared, emulsified in xylene, and tested for insecticidal
     properties by spraying on flies and on beans which were then fed to the
     Mexican bean beetle, the Southern army worm, and the pea aphid. In a
     typical preparation, 41 g. 2-nitro-1-p-tolyl-1-propanol was added to a mixture

     The condensation of cyclohexanone and its derivs. with
     1,3-dichloro-2-butene (I) and the subsequent cyclization of these products
     was studied with particular reference to steric effects and orientation.
     2-Methylcyclohexanone (12 g.) and 12.5 g. I in 50 cc. C6H6 agitated and
     cooled with ice, 2N Na amvlate added slowly, the mixture kept at room
temperature
     for 1 hr., and then refluxed for 3 hrs. gave
     2-methyl-2(γ-chlorocrotyl)cyclohexanone (II), b14 130°, n17D
      1.4941; semicarbazone, m. 153-5°; 2,4-dinitrophenylhydrazone, m.
     133-5°. 1,4-Dimethylbicyclo[3.3.1]non-3-en-9-one, b19
     106-35° (semicarbazone, m. 204-6°;
     2,4-dinitrophenylhydrazone, m. 151-3°), was obtained by treating 5
     g. of II with 10 cc. concentrated H2SO4. A small amount of
     A1(9)-10-methy1-2-octalone was obtained on chromatographing the
     mother liquor from the hydrazone on alumina. Similarly on treatment with
     I, cyclohexanone gave 2-(y-chlorocrotyl)cyclohexanone, which
     cyclized to 45% A1(9)-2-octalone and
     4-methylbicylo[3.3.1]non-3-en-9-one, b15 110-15°; semicarbazone, m.
     215-17°; 2,4-dinitrophenylhydrazone, m. 199-201°. Similarly
     isophorone (III) and I gave 3,5,5-trimethy1-2-(γ-
     chlorocrotyl)cyclohex-2-en-1-one, b18 159°, n15D 1.5095;
     semicarbazone, 134-6°; 2,4-dinitrophenylhydrazone, m.
     133-5°, which on treatment with H2SO4 gave
     3,5,5-trimethyl-2-(3-oxobutyl)cyclohex-2-en-1-one (IV), b0.1 102°,
     n15D 1.4924; disemicarbazone, m. 199-201°;
     mono-2,4-dinitrophenylhydrazone, m. 170-2°. IV on ozonization gave
     3,3-dimethyl-5-oxohexanoic acid (V), the same product obtained by KMnO4
     oxidation of III. Condensation of III with CH2:CHCN in the presence of Na
     tert-amylate gave 3,5,5-trimethyl-2-(γ-cyanoethyl)cyclohex-2-en-1-
     one (VI), b0.5 124-5°, n21D 1.4930; semicarbazone, m.
     189-92°; 2,4-dinitrophenylhydrazone, m. 162-4°. VI was also
     ozonized to V. VI on saponification gave the corresponding acid.
     3,5,5-trimethyl-2-(γ-carboxyethyl)cyclohex-2-en-1-one (VII), m.
     74-6°; semicarbazone, m. 211-13°. Condensation of III with
     Me acrylate gave the Me ester of VII, b15 166-7°;
     2,4-dinitrophenylhydrazone, m. 124-6°. Saponification of the ester gave a substance m. 144-7, probably a lactone. IV on treatment with NaOMe in
     MeOH gave 5,7,7-trimethyl-2-oxo-2,3,4,6,7,8-hexahydronaphthalene (VIII),
     b0.1 105°, n19D 1.5542; semicarbazone, m. 206-10°;
     2,4-dinitrophenylhydrazone, m. 170-2^{\circ}. VIII was hydrogenated over PtO2 to 5,7,7-trimethyl-2-decalol, m. 133-5^{\circ}, which was in turn
     oxidized by the method of K. Bowden, et al. (C.A. 40, 2787.8), to the
```

corresponding ketone; 2,4-dinitrophenylhydrazone, m. 156-9°. Dihydroisophorone and I gave 3,5,5-trimethyl-2-(y-chlorocrotyl cyclohexanone, b15 149°, n20D 1.4851 (semicarbazone, m. 136-8°; 2,4-dinitrophenylhydrazone, m. 110-12°), which on treatment with H2SO4 yielded A1(9)-5,7,7-trimethyl-2-octalone, b18 154°, n22D 1.5088 (semicarbazone, m. 205-8°; 2,4-dinitrophenvlhvdrazone, m. 184-5°). 3-Methyl-2-cyclohexen-1-one also condensed with I to form 3-methyl-2-(y-chlorocrotyl)cyclohex-2-en-1-one, b13 146°, n21D 1.5242 (semicarbazone, m. 194-7°; 2,4-dinitrophenylhydrazone, m. 123-4°), which on treatment with H2SO4 yielded 3-methyl-2-(3-oxobutyl)cyclohex-2-en-1-one (IX), b14 153-4°, n18D 1.5052. IX on refluxing with Na in MeOH gave 5-methyl-2-oxo-2, 3, 4, 6, 7, 8-hexahydronaphthalene, b14 156-8°, n19D 1.5738; semicarbazone, m. 195-7°; 2,4-dinitrophenylhydrazone, m. 191-4°. 4-Carbethoxy-3-methylcyclohex-2-en-1-one and I gave 4-carbethoxy-3-methyl-2-(y-chlorocrotyl)cyclohex-2-en-1-one (X), b0.8 151-3°; semicarbazone, m. 142-4°; 2,4-dinitrophenylhydrazone, m. 122-3°. X was treated with H2SO4 and the neutral fraction heated with EtONa to obtain 5-methyl-2-oxo-6-carboxy-2,3,4,6,7,8-hexahydronaphthalene, m. 124-6°; 2,4-dinitrophenylhydrazone of the Me ester, m. 142-5°. Phenylnitromethane and 3,4-ethylenedioxybenzaldehyde are condensed in the presence of CH3NH2-HCl to give 3', 4'-ethylenedioxy-α-nitrostilbene, m.p. 142-3°; this compound is reduced with Zn dust and AcOH and subsequently Na-Hg to give the corresponding dihydrostilbylamine-HCl, m.p. 225-8°. Its activity against in vitro fibroblasts (0.75 \(\gamma/ml.\)) is 4 times that of the corresponding dioxymethylene compound (3 y/ml.). N-Methylformanilide and POC13 are treated with catechol tetramethylene ether; the aldehyde obtained by this method is condensed with phenylnitromethane and reduced to give 3',4'-tetramethylenedioxydihydrostilbylamine. This compound shows no mitosis-poison activity. AB cf. A. 42, 67831. When Combe's synthesis (Compt. rend. 106, 142, 1536 (1888)) was applied to 2-C10H7NH2 (1) by Johnson and Mathews (C.A. 38, 1505.6), only linear cyclization was effected, which is an exception to the usually observed angular cyclization reaction. The structure of the side chain in position 2 on the C10H8 nucleus is evidently important, and the usually accepted -N:CRCH2COR appears less satisfactory than does the "enamine" structure, -NNCR:CHCOR, which is adopted by H. Conditions for forming nonanellated products and the theory underlying linear ring closure are discussed at length. 2-(Ac.CH:CMHH)C10H7 (II), m. 99°, was prepared by heating I with Ac2CH2 (III). On oxidation, II gave the Ac derivative of I, m. 132-3°, and, when heated at 290° in paraffin oil, followed by extraction with MeOH, evaporation, extraction with C6H6, and

acidification, gave I.HCl. At 0° 1 g. II and 6 cc. concentrated H2SO4 gave 2, 4-dimethylbenzo[g]quinoline (IV), but with H3PO4 at 70°, followed by extraction with NH3 in CHCl3, II gave largely I and only small amts. of IV. By the cyclization of appropriate enamines the following derivs. of IV were formed: 8-Br. pale yellow, m. 168-9° (from the enamine prepared from III and 1,2-H2N(Br)Cl0H6), and 8-Me, m. 127° (prepared from the enamine, m. 95°, formed from III and 2-H2N(CR)Cl0H6Me). The 3-Br derivative (V) of I and III gave 2-(3-bromo-2-naphthylamino)-2-penten-4-one, needles, m. 95° (from Et2O), which with concentrated H2SO4 at 0° gave 83% V. I (10 g.) and 17 g. B2CH2 at 130° gave the enamine, 2-(B2CHCPHNH)-Cl0H7 (VI),

yellow needles, m. 146-7°, nonfluorescent, unaffected by hot aqueous acids or alkalies, and unchanged when heated at 300° in paraffin, but forming 2-BzhHclOH7, m. 159-60° and B2OK when oxidized with KMn04 in MeZCO. With 90 cc. concentrated H2SO4 at 0°, 15 g. VI gave an orange-red sulfate which was washed with ice-H2O, dried, extracted with H2O

KMn04 in Me2CO. With 90 cc. concentrated H2SO4 at 0°, 15 g. VI gave an orange-red sulfate which was washed with ice-H2O, dried, extracted with H2O and CHC13, and the dried CHC13 extract was passed through A12O3, evaporated, and

crystallized from EtOH at 40°, giving 10.81 g. 2, 4-diphenylbenzo[g]quinoline (VII), pale yellow, m. 146° (from CHCl3-EtOH), showing in alc. an unusually brilliant pale blue fluorescence veering to faint yellow on addition of acid, and, from the mother liquor of VII, 1.2 g, of the angular [f]-isomer (VIII), m. 146°, separated after tedious, successive fractionations from Me2CO, AcOEt, and MeOH. A simpler means of separating VII and VIII was to irradiate the mixture in Me2CO, thus forming the insol. dimer (IX) of VII, the mother liquors from which gave nearly pure VIII. When mixed, VII and VIII shwed m.-p. depressions of 20-30°. With glacial AcOH and CrO3, 1.5 g, VII formed an insol. orange-red bichromate, which, when heated, gave 1.39 g, yellow 2,4-diphenyl-1-azanthraquinone, C25H1SDO2, m. 250-10 (from glacial

AcOH or C6H6). VII (0.3 g.) gave 0.375 g. of a sulfonic acid, C25H16N5O3H, orange-red needles (from EtOH), m. above 300°. Heated with quinone in C6H6 VII gave the adduct (X), colorless, nonfluorescent, dissociating and foaming at 204-6°, and giving a clear melt at 240°. A 24-hr. solar photodimerization of VII in C6H6 gave IX, C50H31N2, colorless, m. 273 ° (from C6H6), showing a faint blue fluorescence and quantitatively depolymerized to VII on melting. VIII was effectively prepared by gradually adding 0.5 g. VI to 2nc12 at 200% heating 1 hr., decomposing the melt with H2O, extracting with CHCl3, passing the extract

through Al203, evaporating, and crystq, from MeOH; yield 0.28 g. VIII. VIII in alc. showed a bluish-violet fluorescence; VIII forms difficultly soluble HCl and H2SO4 salts. In alc., VIII proved stable on irradiation, but a photochem. reaction occurred rapidly on addition of a few drops of H2SO4, giving (from 0.15 g. VIII) 0.136 g. of a compound (XI), felted needles, m. 220° (from CHC13-EtOH). Bz2CH2 and the 1-Me derivative of I gave the corresponding enamine, m. 163-4°, which when cyclized at 5° with H2SO4 gave 96% of the 8-Me derivative (XII) of VII, m. 138-9° (from EtOH-CHC13), whose photodimer, colorless crystals with bluish-green surface sheen, m. 246-7° XII when added to a ZnC12 melt gave a compound, (1-MeClOH6)2NH (?), m. 221-4° (insol. even in concentrated acids). The 1-Br derivative of I and Bz2CH2 gave an enamine, vellow leaflets, m. 174°, difficultly cyclized after standing 24 hrs. in concentrated H2SO4 to give a poor yield of an impure (linear ?) pale yellow bromobenzoquinoline, m. 199-204° (containing 77.41%°C instead of the calculated 73.16%); when this enamine was heated with ZnCl2, small amts. of VIII were formed. The 3-Br derivative of I and Bz2CH2 reacted slowly at 130° to give the enamine, C25H18NOBr, m. 131°, which when fused with ZnC12 gave 1,3-diphenyl-5-bromobenzo[f]quinoline, m. 152-3° showing weak violet fluorescence. Bz2CH2 and freshly distilled 2-amino-1,2,3,4-tetrahydronaphthalene gave an enamine, m. 135° which with H2SO4 at 5° gave 92% (linear) 2,4-diphenyl-6,7,8,9-tetrahydrobenzo[g]quinoline (XIII), m. 129°, showing a blue fluorescence, also formed from the enamine by ZnCl2 fusion. Dehydrogenation of XIII with Pt-C gave VII; no VIII was formed. I and BzCH2Ac at 130° gave 96% of the corresponding enamine, m. 152-3°, which yielded 2-methyl-4-phenylbenzo[q]quinoline (XIV), b12 260°, m. 110° (from petr. ether) [cf. Bever, Ber. 20, 1767 (1887)]. Similarly, the 1-Me derivative of I and BzCH2Ac gave 90% of an enamine, pale yellow prisms, m. 158°, which gave 70% of the 8-Me deriv, of XIV, m. 105-6°. The enamine, m. 133-4°, prepared from 3.2-BrC10H6-NH2 and BzCH2Ac could not be cyclized by the usual procedure with H2SO4. Ultraviolet absorption spectra of VII and VIII are given.

    5-(Chloromethyl)hydrindene (30 g.) in 75 ml. EtOH, added (0.5 hr.) to 11
     g. NaCN in a min. quantity of hot H2O and refluxed 4 hrs., gives 73%
     5-hydrindeneacetonitrile (I), b2.5 113-15°; 58 g. I and 4 g. Raney
     Ni in 100 ml. EtOH containing 19 g. NH3, hydrogenated (4 hrs.) at 110°
     and 1100 lb., give 98% 2-(5-hydrindenyl)ethylamine (II), b4 104-7°,
     analyzed as the phenylthiocarbamyl derivative, m. 96.5-7.5°. I (75 g.)
     in 24 g. absolute EtOH and 70 ml. ether, treated with 21 g. HCl, kept 16 hrs.
     at 5°, and the imido ester hydrolyzed (24 hrs.) with H2O, gives 40
    g. of the Et ester, b3 122°, nD25 1.5201, of 5-hydrindeneacetic
     acid (III), m. 113-14° (anilide, m. 122.5-3.5°). The acid
     chloride of III (19.4 g.), added to 16.1 g. II in 7.6 g. C5H5N and boiled
     5 min., gives 47% N-[2-(5-hydrindenyl)ethyl]-5-hydrindeneacetamide (IV),
     m. 99-100°. IV (6 g.) in 65 ml. hot xylene, added to 12 g. P2O5,
     the mixture boiled 15 min., 6 g. P205 added, the mixture boiled an addnl. 0.5
     hr., the xylene decanted, the residue heated with 100 ml. H2O, the

    min. at 180-200°, give 1.3 g.
     1-(5-hydrindenylmethyl)-6,7-cyclopentenoisoquinoline, m. 91-2°. II
    (8.86 g.) and 11 g. homopiperonylic acid, heated 4 hrs. at 160-70°,
    give 13.9 g. N-[2-(5-hydrindenyl) ethyl]homopiperonylamide (VI), m.
    119-20°; 5.5 g. VI, cyclized as above and dehydrogenated, gives 0.8
    g. 1-(3,4-methylenedioxybenzyl)-6,7-cyclopentenoisoguinoline, m.
     98-9°. The crude acid chloride from 17.6 c. III in 100 ml. C6H6,
     treated slowly with 16.5 g. homopiperonvlamine and 7.6 g. C5H5N in 50 ml.
     C6H6 and boiled 10 min., give 61% N-[2-(3,4-methylenedioxyphenyl)-ethyl]-5-
     hydrindeneacetamide, m. 122.5-3.5°; cyclization of 2 g. with P205
    gives 0.7-0.8 g. 1-(5-hydrindenylmethyl)6,7-methylenedioxy-3,4-
    dihydroisoquinoline (VIa), m. 130.5-10 (picrate, m. 175-60);
     5.9 g. (VIa) and 1.3 g. 10% Pd-C, heated 3.5 hrs. at 155-200°, give

     1-(5-hydrindenylmethyl)-6,7-methylenedioxyisoquinoline, m. 168-9°
     (picrate, m. 184-5°). II (5.33 g.), 2.57 g. AcCl, and 2.6 g. C5H5N in C6H6 give 3 g. of the Ac derivative, b2 170-85° (bath temperature), m.
     77.5-8°; cyclization gives 1-methyl-6,7-cyclopenteno-3,4-
    dihydroisoguinoline, analyzed as the picrate, m. 205°; oxidation of
     the base with HNO3 gives 1,2,4,5-C6H2(CO2H)4, indicating that cyclization
     in the hydrindene series occurs across the 5,6-positions of the hydrindene
     nucleus. 6-Acetyl-1,2,3,4-tetrahydronaphthalene (50.9 g.), 10 g. S, and
     26 g. morpholine, heated 8.5 hrs. at 120-5°, give 90%
     1,2,3,4-tetrahydro-6-naphthalenethioacetomorpholide (VII), m.
     114.5-15.5°; 58.4 g. VII in 1 1. 10% KOH, boiled 10 hrs., gives 79%

cf. C.A. 43, 311a. Compds. studied were the series 1-C10H7CH2N(R)CH2CH2C1

where R = Me, Et, Pr, iso-Pr, allyl, Bu, sec-Bu, iso-Bu, Am, hexyl, 2-methoxyethyl, and 2-chloroethyl, and also

N-ethyl-N-2-hydroxyethyl-1-naphthylmethylamine,

N-ethyl-N-2-chloroethyl-1-(4-chloronaphthyl)methylamine, and

N-ethyl-N-2-chloroethyl-2-naphthylmethylamine and its 5,6,7,8-tetrahydro derivative; all as HCl salts. They exhibited the dual property of strongly blocking certain effects of both adrenaline and its physiol, antagonist histamine. The lower alkyl homologs in oral doses of 3-17 mg./kg. were effective in reducing the toxicity of adrenaline in mice; the toxic doses were 60-360 times as great. Injected i.v. in dogs, the compds. reversed

the action of adrenaline and diminished the pressor response to injected histamine; their effect was of long duration. S.c. in guinea pigs, they reduced the toxicity of histamine aerosol and the histamine released during anaphylaxis. The most effective compds. were N-ethyl-N-2-chloroethyl- and N-ethyl-N-2-bromoethyl-1-naphthylmethylamine

(SY-14 and SY-28).

AB Useful wetting, dispersing, and washing agents result from condensation of sulfonamides with aryl chloromethyl compds. Solubility in H2O is achieved by polar groups, such as -SO3Na or -OSO3H. Thus p-cymene is converted with ClSO3H, followed by NH3, to a mixture of cymenesulfonamides, 53 parts of which is treated with 50 parts of Na formaldehyde bisulfite (I) and 2.5 parts of diamylamine for 20 min. at 160-5°; 7 parts of the product is dissolved in 14 parts of H2O and 3.2 parts of 6-(chloromethyl)-1,2,3,4-tetrahydronaphthalene (II) and 2.9 parts of 30% NaOH is added at 65-70° during 1 hr. The mixture is stirred, excess NaOH is neutralized, and by evaporation to dryness a product is isolated, probably of the formula Likewise 10 parts of the product obtained by the reaction of the tetrahydronaphthalenesulfonamides (III) with I is dissolved in 20 parts of H2O and 4.4 parts of II is added and heated with 3.9 parts of 30% NaOH until a sample dissolves in H2O (2 hrs. at 65-70°). Similar products may be obtained with Na formaldehydesulfoxylate, and with a (chloromethyl)cymene (IV), or from the complex mixture which results when tetrahydronaphthalene is heated with AlC13 at 100°. A technical grade of III will react in aqueous alkali with CH2C1C02H to yield tetrahydronaphthalene-sulfonamidoacetic acids which react similarly with II to give a soluble washing powder. Another variation consists in preparation of the isomeric N-hydroxyethyl-p-cymenesulfonamides (from the sulfonyl chloride and CH2(OH)CH2NH2) and treating them with IV, followed by treatment with ClsO3H, and then H2O, to give the acid sulfate. Also, 15 parts of the condensation product (V) from the Na salt of 2-amino-6,8-naphthalenedisulfonic acid (VI) and

N-chloroacetyltetrahydronaphthalenesulfonamide is dissolved in 25 parts of H2O at 70° and 4.5 parts of II and 3.7 parts of 30% NaOH are added; stirring at 65-70° for 30 min. gives a H2O-soluble product which, however, reacts further with 4.5 parts of II, condensation apparently taking place at both the amido and amino H. V can be made as follows: 46 parts of III is heated with 24.6 parts of CH2C1COC1 to 100° in the course of 2 hrs., and heating is continued for 2.5 hrs. at 100°; 14.4 parts of the chloroacetyl derivative is mixed with 6.7 parts of 30% NaOH and 7.5 parts by volume of EtOH and is dropped during 2 hrs. at 65-70° into a solution of 24.3 parts of VI (partly neutralized as the

Na acid salt), containing 62.4% free disulfonic acid, in 50 parts by volume of H2O, made neutral with Na2CO3; V was isolated by evaporation of the reaction mixture to dryness, after it had been stirred for 2.5 hrs. at 70°. 854747-58-3P, Methanesulfonic acid,

AB	Aminosulfonic acids	are tr	eated with a	aralkylating agents cont	aining at least
	C atoms to form N-a	ralkyla	minosulfonio	acids which are useful	as wetting,

dispersing, washing, softening, leveling, or foaming agents in the treatment of textiles. For example the Na salt of sulfanilic acid in aqueous Na2CO3 solution is treated with ar-2-(chloromethyl)tetrahydronaphthalene (I) at 70-80° to form the Na salt of N-(ar-2-tetrahydronaphthylmethyl)sulfanilic acid, which is salted out and dried. Similar compds. or their salts are prepared in a like manner by treating salts of the following aminosulfonic acids with I: 1,6-naphthylaminesulfonic acid, 2,6,8(and 1,3,6)-naphthylaminedisulfonic acid, and β -aminoethanesulfonic acid. One or both free H atoms in the NH2 may be replaced in accordance with the amount of aralkylating agent used. Products containing the N-tetrahydronaphthylmethyl radical have excellent washing properties, and those containing 2 SO3H groups are particularly good in hard water. Similarly N-(cymylmethyl)aminosulfonic acids and their salts are prepared in a like manner by treating salts of the following aminosulfonic acids with 2-(chloromethyl)cymene: N-methylsulfanilic acid, 2,6,8-naphthylaminodisulfonic acid, phenylhydrazinesulfonic acid, and β-aminoethanesulfonic acid. Again one or both H atoms on the NH2 group may be replaced. Products containing the cymylmethyl group have particularly good wetting properties. Products containing a free amino H atom may be treated with ethylene oxide or an acyl

(or-CH2CH2COCH2CH2OH) or an acyl group, resp., on the N atom. 1857954-48-4P. AB According to Kuhn and his school, in the pigment component of the lactoflavin in vitamin B2 2 o-Me groups in a certain position are responsible for the physiol. action. Flavins not methylated on the benzene nucleus and those in which the Me has been shifted from the 6- to the 5- or from the 7- to the 8-position have no growth effect (C. A. 31, 6239.6). The object of the present work was to synthesize heterocyclic substances containing o-Me groups in corresponding positions. Kunckell and Schneider had observed (C. A. 7, 777) that in the action of ClCH2COCl on 3,4-Me2C6H3NHAc (I) in the Friedel-Crafts reaction the C1CH2CO group enters the o-position to the NHAc group, the latter having an o-, the 3-Me group a p-directing influence. It was to be expected that 2-acetamino-5,6,7,8-tetrahydronaphthalene (II) and 5-acetaminohydrindene (III) would behave in the same way, the cyclic methylene residues having the same influence as the 2 o-Me groups in I. Such proved to be the case. 5,6,5',6'-Tetramethylindigo (IV), from 3,4,6-Me2(C1CH2CO)C6H2NHAc and alkali, was oxidized to 5,6-dimethylisatin (V), best with HNO3CrO3 (Ger. pat. 229,815, C. A. 5, 2732). The corresponding dyes were likewise obtained in good yields from the C1CH2CO derivs. of II and III. The 3 isatins with PhCOMe in alkaline solution gave the 6,7-substituted 2-phenylquinoline-4-carboxylic acids. These acids, as compared with atophan, showed no greater pharmacol. action and about the same, or perhaps somewhat higher, toxicity; they have no vitamin B2 action and have no advantages over other atophan derivs. in their influence on uric acid metabolism An attempt was also made to introduce the above substituents into acridines. 2'-Chloro-4.5-dimethyl-2-aminobenzophenone (VI) was prepared from I and o-ClC6H4COCl but attempts to effect ring closure to the acridone with Cu(OAc)2 in AmOH and even by heating in PhNO2 with Cu and K2CO3 failed. 3',4'-Dimethyldiphenylamine-2-carboxylic acid (VII) was accordingly prepared by heating 3,4-Me2C6H3NH2 and o-ClC6H4CO2H with Cu and K2CO3; ring closure to 2,3-dimethylacridone (VIII) was easily effected with concentrated H2SO4 at 80°. VIII was quant. reduced with Na and AmOH to the dihydroacridine (IX) which with FeCl3 yielded 2,3-dimethylacridine (X) through a green addition product, IX.X. 2,3-Cyclotrimethylene- (XI) and 2,3-cyclotetramethyleneacridine (XII) were prepared in the same way. The tolerated doses, s.c., per 20-g. mouse weight of X, XI, XII and acridine (XIII) are resp. 40, 20-40, 20 and 2 mg. The dilns. (1:x) at which they inhibit growth in vitro of streptococci are 100, 200, 200, 8000; of staphylococci 200, 200, 200, 4000; of pneumococci 500, <500, 500, 8000. Local disinfection expts. on animals gave similar results; only with

gonococci did the new acridines prove nearly as effective as XIII itself. Hence, 2,3-substitution of XIII decreases the toxicity but also the disinfecting power. I (82% from Me2C6H3NH2 and AcCl in pyridine), m. 96.5°. 6-C1CH2CO derivative (94%), m. 167°. IV (55%) forms an

     2-C10H11NHOH → H2O + 2,2'-azoxytetralin. The velocity of formation
     of azoxybenzene (I) is accelerated by a very small concentration of HO ion; the
     effect is much greater than with H ion. Under similar conditions 3.3'-
     and 4,4'-azoxytoluene are formed more rapidly but the 2,2'-isomer (II)
     much more slowly than I. 2,4,2,',4'- and
     2,5,2',5'-tetramethylazoxybenzene are formed not only more slowly than I
     but also more slowly than II. 3,3 -Dinitroazoxy compds. (III) are formed
     considerably more rapidly than the parent compds. The velocity of
     formation of III is decreased by the presence of an o-Me group but is
     raised by a p-Me group. Cl in the o-position to the NO and NHOH groups
     decreases the rate of reaction but in the m- and p-positions it
     accelerates it. 2,2'-Dinitroazoxybenzene is formed half as fast, the
     3,3'-isomer 5/3 as fast and the 4,4'-isomer 6.5 times as fast as. I.
     1,1'-Azoxynaphthalene is formed in 70% alc. at a rate only slightly less
     than that of I under similar conditions; consts. could not be determined for
     acid and alkaline solns., probably because of side reactions. The following
     new compds. are reported: 1,2-dimethyl-2-nitro-6-hydroxylaminobenzene,
     yellow, m. 87°; 1,4-dimethyl-2-nitro-6-nitrosobenzene, m.

Catalytic hydrogenations under pressure in the TITLE:

AB cf. C. A. 17, 2884. With the author's apparatus nitriles can be quickly and smoothly reduced to mixts. of primary and secondary bases (80-95% yields); only in the case of aliphatic nitriles, especially of the lower series, does the reduction soon come to a standstill, probably because the catalyst is paralyzed by slight decomposition products. The pressure has no influence on the nature of the reduction products and the influence of temperature is also not marked and is very variable; to avoid this last factor the present work was almost all done at 115-25°. Two factors whose influence is extraordinarily pronounced are the nature of the solvent and the concentration The sum total of the reduction products always increases in passing from hydrocarbons like tetra- or decahydronaphthalene to solvents containing O (alcs., ethers), and by varying such O-containing solvents, an extraordinarily marked shifting of the yield in favor of the primary or of the secondary base can be effected. In all solvents, increasing concentration favors the formation of the primary base, often to a very considerable extent. The mechanism of the reaction is probably as follows: RCN → RCH:NH → RCH2NH2; RCH:NH + RCH2NH2 o-Substitution products of PhCN give, under the same conditions, less secondary base than m- and p-derivs., α -tetralyl cyanide gives less than the β -isomer. When an alc., R'OH, with an especially mobile HO group (PhCH2OH, cyclohexanol) is used as solvent, mixed bases are also formed: RCH:NH + R'OH → RCH(OH)NHR' → RCH:NR' → RCH2NHR'. The Ni salt was reduced in an autoclave in the desired solvent, then the nitrile, in the amount of solvent necessary to give the desired concentration in the mixed solution, was drawn in and the reduction effected under an average excess pressure of 20 atmospheric The H was absorbed at the rate of 1 1. in 2-6 min. Heptyl cyanide, b15 87-8°, in tetralin or decalin gives in 25% solution 15 and 18%, in 70% solution 17 and 21%, resp., of octylamine, b14 72-3°, and dioctylamine, b14 175°. PhO(CH2)3CN (I) in tetralin (24%) gives 29% PhO(CH2)4NH2, b12 140°, and 47% de-δ-phenoxybutylamine, b15 266°, m. 51-2° (HCl salt, m. 165°; NO derivative, m. 50°; the picrate, Ac and Bz derivs. are oils); heated several hrs. at 100° with fuming HBr, the sec. amine yields di-δ-bromobutylamine dihydrobromide (II), m. 200°, whose aqueous solution, treated with exactly 2 mols. NaOH, almost immediately becomes neutral and clear; on evaporating, extracting with CHC13

and

adding Et20 there is at once precipitated the very hygroscopic bispyrrolidinium bromide, C8H17NBr3, m. 256-8°; the primary product, N-δ-bromobutylpyrrolidine, (CH2.CH2) 2N (CH2) 4Br, formed by intramol. alkylation of the free base of II, cannot be isolated even when the reaction mixture is carefully cooled. When the I is reduced in cyclohexanol (17-25% solution) there is formed, in addition to 37 and 30%, resp., of the

```
above primary and sec. bases, 15% of the mixed
     cyclohexyl-γ-phenoxybutylamine, b16 177-9°, isolated as the
     picrate, m. 110°; the HCl salt is deliquescent and the NO derivative
     oily. The yields of PhCH2NH2 (III), b13 75-80°, and of (PhCH2)2NH
     (IV), b13 160-5°, resp., from PhCN in various solvents (% concentration of
     the solution in parentheses) are as follows: decalin or tetralin (9) 44, 40,
     (25) 41, 35 (66) 72, 5; EtOH (9) 59, 14, (66) 71, 8: Am2O (20) 41, 39; in
     cyclohexanol (16%) in addition to 24 and 11% of III and IV is obtained 35%
     cvclohexylbenzylamine, b15 145-7° (HCl salt, m. 284°; NO
     derivative, m. 43°; PhSO2 derivative, m. 90°); in

When tetralin (A) is treated with CO and HCl in the presence of AlCl3 it is impossible to prevent the greater part of the A from condensing with itself in the same way as it does with AlCl3 alone (Schroeter, C. A. 15, 525); the small part that does react with the CO and HCl gives exclusively the ar-tetralin-β-aldehyde (B) (2 g. from 100 g. A). Both B and the α -isomer (C) can be obtained from the ar-tetralin- β - and a-methylamines (D and E, resp.) through the corresponding alcs. Bamberger and Lodter's statement that α-C10H7CH2NH2 on reduction takes up the H in the substituted nucleus (Ber. 20, 1708(1887)) seemed to exclude this compound and the β -isomer as the starting points in the synthesis of B and C. Accordingly the NH2 group in the $\alpha-$ and β-tetralylamines was replaced by CN, which was then reduced to CH2NH2, but the yields are poor. On repeating B.'s work, however, it was found that it is the unsubstituted nucleus which takes up the H on reduction and that the pure D and E can easily be obtained in this way. $ar-\alpha$ -Tetralyl cyanide, obtained in 22% yield from the amine by the Sandmeyer reaction, b15 153°, solidifies to a yellowish crystalline mass m. 48° (Bamberger and Bordt, Ber. 22, 625(1889), describe it as an oil b121 277-9°, which does not solidify), hydrolyzed by fuming HCl in a sealed tube at 120° to the acid, m. 150° (B. and H. give 123°); reduction of the nitrile with Na and alc. gives chiefly A and only about 1/3 is converted into E, oil of basic odor, bl1 149-52°, eagerly absorbs CO2 from the air, also obtained in almost 90% yield from α-C10H7CH2NH2 with 8 atoms of Na in AmOH (in EtOH there is very little reaction); hydrochloride, silvery needles from alc., m. 253°; picrate, golden yellow prisms from alc., m. 242°; acetyl derivative, m. 125°; benzoyl derivative, m. 144°; phenylurea, m. 199°; phenylthiourea, m. 153°. The corresponding ar- α -tetralylmethylamine (from α -C10H7CN with Na and alc.) forms a hydrochloride m. 230°, picrate m. 169-70°, phenylurea m. 126°, and benzoyl derivative m. 125°. ar-β-Tetralyl cyanide (obtained in 45-60% yield), liquid of a not unpleasant odor, b11 151-2°, m. 20-1°, gives with Na and EtOH 30% of D, b11 146-8°; hydrochloride, m. 248°; picrate, m. 215°; benzoyl derivative, long needles from alc., m. 165°, bl0 260-5°; p-nitrobenzoyl derivative, m. 170°; phenylthiourea, m. 130°. D is also obtained in almost 90% yield from β -C10H7CH2NH2 with Na and AmOH. ar- α -Tetralylcarbinol, obtained in 80% yield from E diazotized in AcOH with the calculated amount of NaNO2 and heated on the H2O bath until the evolution of gas ceases, b12 154-5°, gives in H2SO4 with the calculated amount of K2Cr2O7 1/3 of its weight of C, b12 131-3°, as an almost odorless oil; semicarbazone, m.

ar- β -Tetralylcarbinol (yield, 70%), faintly yellow liquid with a strong pleasant odor, bl4 148-52°, gives on oxidation 25% of B, liquid of characteristic peppermint-like odor, bl4 138°; semicarbazone, m. 219°.

The work described covers the nitration of C10H12, the reduction of various mono-, di-and tri-NO2 derivs., and the nitration of the Ac derivs of the amines so obtained. The orientations of a considerable no.of isomeric compds. are definitely established. The mononitration of C10H12, using a mixture of HNO3and H2SO4, leads to the formation of both 1-and 2-nitro-ar-tetrahydronaphthalene, which may be separated by fractional distillation and "freezing out" the fractions or by taking advantage of the

fact

that the 2-NO2 compound is more easily reduced than its isomer to an NH2 derivative 1-Nitroderiv. m. 34°, b13 157°, d4040 1.1757, and the 2-NO2 deriv.m. 31.4°, b13 169°, d40401.1762. On

dinitration, C10H12 yields a mixture of 1-2- and

1-3-dinitro-ar-tetrahydronaphthalene (1,2-derivative,m. 102-3°: 1,3-derivative, m. 95°) which may be separated by crystallization from

concentrated H2SO4

in which the former is less soluble The orientation of the 1,2-compound rests on its reduction (see below) and that of the 1,3- derivative on its oxidation to 3,5-(O2N)2C6H2(CO2H)2 and its reduction. Another oxidation product with HNO3 is β -o-carboxytrinitrophenylpropionic acid, which decomps. violently on heating. The potassium hydrogen salt was analyzed. The 1,3-derivative cannot be further nitrated. The 1,2-derivative yields 1,2,4-trinitro-ar-tetrahydronaphthalene, m. 94.5-5°, the structure of which was established by reduction.1,1-Hydrazo-artetrahydronaphthalene, by reduction of the 1-NO2 derivative with Zn dust and alkali, slender needles, m. 181-3°, and on oxidation with KMnO4 is converted quant, into 1.1-azo-ar-tetrahydro-naphthalene, glistening red needles, m. 190-1°, also obtained, with the 1,1-azoxyderivative, yellow needles, m. 184°, by reduction of the NO2 derivative with Zn and NaOH under less energetic conditions. The benzidine conversion gives rise to 4,4'-diamino-1,1'-di-ar-tetrahydronaphthyl, m.153-4°. The hydrochloride, hydrobromide, sulfate and phosphateare described. The corresponding diazonium salt gives substantive dves on coupling with various intermediates. 4,4'-Dihydrazino-1,1'-di-ar-tetrahydronaphthyl is formed by reduction with SnCl2; 4,4'-diethoxyderivative, needles, m. 173°. A compound, probably 1,1'-diamino-2,2'-di-artetrahydronaphthyl, results as by-product in the preparation of the 4,4'-derivative, needles, m.216°; on heating the HCl salt, it yields NH4Cl and a carbazole-like base, separated as the picrate. α-andβ-C10H11NH2 are obtained from the corresponding NO2 compds. by catalytic reduction and may also be obtained by reducing the crude mononitration product of C1012 and separating the isomeric bases by the differences in solubility of their HCl salts in H2O, their methanedisulfonates

in 96% EtOH and the difference in the ease with which the bases react with
Ac20.α-C10H11NH2.HCl is more easily soluble in H2O than the
\beta-derivative The methanedisulfonate, leaflets, is soluble in 20 parts hot
H2O, 60 parts cold H2O and 6 times as soluble in EtOH as the \beta-derivative
C6H4(CO)2O givesα-tetralylphthalamic acid, needles, m. 182-4°
(decomposition), which loses H2O on heating and gives the imide, long needles,
m. 148-50°. The action of Me2SO4 on the Ac derivative
gives@-acetmethylaminotetralin, needles, m. 70-2°,b11
182-5°. β-Aminotetralin hydrochloride, large leaflets, is
sparingly soluble in cold H2O, as is the sulfate; the methanedithionate forms
leaflets which are sparingly soluble in alc. The phthalamic acid forms
glistening needles, m.156.5-8.5°, and the phthalimide, needles, m.
169-71°. β-Acetmethylaminotetralin, needles, m.
67-9°, b12 178-80°. The nitration of \alpha-C10H11NHAc
yields 1,4-C10H10(NH2)NO2 (Green and Rowe, C. A. 13, 710) and as
by-product, 1-acetamino-2-nitrotetralin, needles m. 184-5°, and
1-acetamino-3-nitrotetralin, needles, m.
193°.1-Amino-2-nitrotetralin, by saponification of the Ac derivative, forms
long orange needles, m. 87-8°. 3-Nitro derivative, vellow
leaflets, m. 78°, is also obtained by regulated reduction of the
1.3-di-NO2 derivative The nitration of B-C10H11NHAc in AcOH gives as the
main product 2-acetamino-3-nitrotetralin, long vellow needles.
m.134-35.5°, while 2-amino-1-nitrotetralin, needles,
m.128-9°, is produced only in small amts. InH2SO4, the main
product is 2-acetamino-4-nitrotetralin, long needles, m. 194°, with
the 3-NO2 derivative as a by-product. 2-Amino-3-nitrotetralin,long red
needles, m. 125-7°. Me2SO4gives the methyl derivative, fine red
needles, m. 113-5°, which, with Ac20, gives an acetyl
derivative, AcNMeC10H10NO2, m. 107-8.5°. 2-Amino-1-nitrotetralin,
red needles, m. 96°, obtained by hydrolysis of the Ac derivative and
also by partial reduction of the 1,2-(NO2)2 derivative
2-Amino-4-nitrotetralin, yellow, m. 55°, which may be diazotized and
which yields 4-nitro-2-hydroxytetrahydronaphthalene, amorphous body.
dizao compound may be easily reduced to 1-02NC10H11.
1,3-Dinitro-2-acetaminotetralin is formed by the further nitration of the
3-NO2 derivative, needles, m. 189-91°. 1,3-Dinitro-2-aminotetralin,
yellow needles, m. 166-8°. 3,4-Dinitro-2-acetaminotetralin,
needles, m. 175-7°, vields, on hydrolysis,
3,4-dinitro-2-aminotetralin, long golden vellow needles, m. 157°.
Tetrahydro-2,3-naphthylenediamine, by catalytic reduction of the 3-NO2
derivative with H.glistening leaflets, m. 135-6°, b13 165°. The
hydrochloride forms glistening leaflets. With AcOH it forms
2,3-tetralylene-µ-methylimidazole, m. 251-2°, and with
phenanthrenquinone 2,3-tetralylenephenanthrazine, pale yellow, glistening
needles, m. 214-6°. 1-Acetamino-2-aminotetralin, m.149-51°,
yields with Ac20 the 1,2-diacetate, m.244-5°;
1,2-tetralylphenanthrazine, small, light yellow needles, m. 230°.
1,3-Diaminotetralin forms pearly leaflets, m. 84-5°, the 3-acetate
of which forms glistening needles, m.110-1°, the 1-acetate, m.
173°, and the diacetate, small needles, m. 245-6°.
Monoacetyl-1,4-diaminotetralin, glistening needles, m. 154-6°.
1,2,3-Triaminotetralin, by reduction of the 3,4-(NO2)2 or the 1,3-(NO2)2
derivative, is unstable in air but gives a crystalline hydrochloride, and a
triacetate, needles, m.285°. 1,2,4-Triaminotetralin, also unstable, forms a triacetate, fine needles, m. 315°.
